

90-Second Pitch Script — Quantum Feature Mapping Lab

A tight, live-demo script for showing this in ~90 seconds — an elevator pitch with the screen as the visual aid, not a recorded video. English and Spanish versions below cover the same beats at the same pace; use whichever fits the room. All numbers are real, unmodified results from the Kipu Quantum Hub benchmark run.

Before you start: have the app open at the landing view, and know the click path for §3 (Live Board → Simulate perillas → "Quantum catches it (Classical misses)") cold — there's no time to hunt for it live.

English

[0:00–0:08] Open [SCREEN] Landing view.

"This is a live demo, no login. It predicts when a hoist cable is about to rupture, before it happens. Here's the key: we don't replace your ML model — we enrich the data that feeds it."

[0:08–0:20] One number [SCREEN] Point at the KPI card / bar comparison.

"Same sensors, richer representation: precision on real ruptures nearly doubles — from 34 to 68 percent. Same model, same training. Only the data changed."

[0:20–1:10] The moment that matters [SCREEN] Open  **Live Board** →  **Simulate perillas** → click **"Quantum catches it (Classical misses)"**.

"Let me show you why. This is a real recorded case — a real rupture. Right now the switch is on Classical: the model looks at these exact numbers and says everything's fine. Same numbers, same machine — flip it to Quantum..." [SCREEN] flip the switch. "...and it catches it. Same data. Same kind of model. The only thing that changed is what the model was given to see."

[1:10–1:30] Close

"That's the whole idea: we don't touch your pipeline, we transform what feeds it. This is live right now at quantum-feature-mapping-lab.vercel.app — try it yourself."

(~230 words. If you're running long, cut nothing from the Live Board moment — trim the opening line instead.)

Español

[0:00–0:08] Apertura [PANTALLA] Vista inicial de la app.

"Esto es un demo en vivo, sin login. Predice cuándo un cable de izaje está por romperse, antes de que pase. Y esto es lo clave: no reemplazamos su modelo de machine learning — enriquecemos los datos que lo alimentan."

[0:08–0:20] Un número [PANTALLA] Señale la tarjeta de KPI / la comparación de barras.

"Mismos sensores, una representación más rica: la precision detectando rupturas reales casi se duplica — de 34 a 68 por ciento. Mismo modelo, mismo entrenamiento. Lo único que cambió fueron los datos."

[0:20–1:10] El momento que importa [PANTALLA] Abra  **Live Board** →  **Simulate perillas** → haga clic en **"Quantum catches it (Classical misses)"**.

*"Se lo muestro. Este es un caso real, una ruptura real. Ahora mismo el switch está en Clásico: el modelo mira estos números exactos y dice que todo está bien. Mismos números, misma máquina — lo paso a Cuántico..." [PANTALLA] cambie el switch. **"...y la detecta.** Mismos datos. Mismo tipo de modelo. Lo único que cambió fue lo que el modelo pudo ver."*

[1:10–1:30] Cierre

"Esa es la idea completa: no tocamos su pipeline, transformamos lo que lo alimenta. Está en vivo ahora mismo en quantum-feature-mapping-lab.vercel.app — pruébenlo ustedes mismos."

(~180 palabras — el español tiende a ir más rápido en este tramo; si sobra tiempo, alargue una pausa en el momento del switch, no agregue texto nuevo.)

Notes for either language

- The Live Board moment is the entire point of doing this live instead of just showing a screenshot — never cut it short to save time elsewhere.
- If asked a question mid-pitch, answer briefly and land on the close line ("we transform the data, not your model") — don't get pulled into the metrics glossary at this length; that's what `demo-guide.md` / `demo-guide-es.md` are for.
- Rehearse the exact click path before presenting — verify against the current build, not from memory.
